For a Bush Red Kangaroo Paw in a pot use, Use **Scotts Osmocote Native Premium Potting Mix**.

This specific mix is essential for your kangaroo paw because standard potting mixes contain too much phosphorus, which can kill native plants.

Scotts Osmocote Native Controlled Release Fertiliser. This low-phosphorus formula safely feeds Australian plants for 6 months. Pair it with a premium, free-draining native potting mix to prevent root rot in Perth's warm climate.

Feeding and Care Tips

- **Application rate**: Mix 2 to 4 tablespoons into the potting mix or apply around the base of the plant in early spring and late summer.
- **Potting mix**: Choose a mix that meets Australian standards and drains very quickly.
- **Watering**: Water well when the plant is actively growing and flowering, but do not leave a saucer of water sitting at the base.
- **Sunlight**: Place the pot where it gets at least 6 hours of direct sun each day
